# ADJUSTMENTS AND MEASUREMENTS PROCEDURES

## INSTRUCTIONS FOR ADJUSTING MIDPOINT ELECTRIC POTENTIAL AND IDLING ELECTRIC CURRENT OF POWER AMPLIFIER UNIT.

To ensure accurate adjustment of the midpoint electric potential and idling electric current of the PMA-232 Power Amplifier Unit (ETC-85), and adjustment should be performed in the manner indicated below:

### 1. MEASURING INSTRUMENTS

A. DC Voltmeter (200mV)

B. DC Ammeter (100mA)

Note: One each of the above mentioned instruments will suffice if a test is conducted on only one channel at a time.

### 2. CONNECTION

A. Connect one DC voltmeter to the left and one to the right channel of the SPEAKER terminals. (See Fig. 18)

B. Remove the plug (red wire) from the No. 1 terminal (+B) of the Power Amplifier Unit (ETC-85) and connect the DC ammeter to each channel. (See Fig. 19)

### 3. PROCEDURES

- Set the power supply at pre-set voltages of the PMA-232 (AC 220/240V:50Hz, 120V (FOR USA, CANADA))
- Wait three minutes after Power switch is ON.

C. For adjusting midpoint voltage, turn the VR-1 (4.7 Kohm) so that voltage reading on the DC voltmeter (V) becomes 0 (zero):  $V=0$ . The condition is abnormal if the value exceeds 100 mV.

D. Following adjustment of the midpoint voltage potential, adjust the idling electric current to 45 mA on the DC ammeter by rotating the VR-2 (470 ohm).  $I=45\text{mA}$ .

Lock it with paint after adjustment is completed.
